

ABSTRACT

An apparatus is disclosed which is configured to announce a transmission from a caller by vibrating in a predetermined manner associated with the caller.

Also disclosed is a method comprising: receiving a transmission from a first caller; identifying the first caller; and vibrating a device in a predetermined manner based on said first caller's identity.

1. An apparatus for announcing a transmission from a caller, comprising:
a. a receiver for receiving a transmission from a caller;
b. a processor for identifying the caller based on the received transmission;
c. a vibrator for vibrating the apparatus in a predetermined manner associated with the caller, based on the identification of the caller.
